

ABSTRACT

An image forming apparatus has a feature in a sheet ejecting section thereof. With a simplified configuration, the image forming apparatus ensures that a tail end of a sheet is prevented from being lifted up at an image forming position.

The image forming apparatus has sheet ejecting rollers (4) arranged below a sheet transport path. The apparatus also has sheet pinch rollers (8), a first lift-preventing roller (1), and a second lift-preventing roller (16) arranged above the sheet transport path. The rollers (8), the roller (1), and the roller (16) are in direct contact with the rollers (4) at respective points in the sheet transport direction.
